

DOCUMENT 1: BUSINESS REQUIREMENTS DOCUMENT (BRD)

Project Name: Automated Reporting System (Google Sheets & Apps Script)
Client: [Client Name]
Prepared By: Mukesh Rathore, Project Manager
Date: July 12, 2026 Version: 1.0

1. Executive Summary

The client currently relies on a fragmented, manual process to aggregate data from multiple Google Sheets, generate reports, and distribute them to stakeholders. This process is time-consuming, prone to human error, and limits real-time decision-making. This project aims to design and deploy an Automated Reporting System using Google Sheets and Google Apps Script. The system will automatically pull raw data, process it, populate a dynamic dashboard, and trigger scheduled email reports, thereby reducing manual reporting effort by 80% and ensuring 99% data accuracy.

2. Business Objectives

- Efficiency:** Reduce manual data consolidation and reporting time by 80%.
- Accuracy:** Eliminate manual copy-paste errors to achieve 99% data accuracy.
- Timeliness:** Ensure 100% on-time delivery of scheduled reports to stakeholders.
- Visibility:** Provide management with a real-time, interactive dashboard for data-driven decision-making.
- Scalability:** Create a modular architecture that can easily accommodate new data sources in the future.

3. Target Audience & Stakeholders

Stakeholder Group	Role / Interest	Primary Need
Executive Management	Report Consumers	High-level visual insights, automated daily/weekly summaries.
Data/Operations Team	Data Owners	Accurate, timely data without manual intervention.

IT / System Admin	Technical Support	Secure, maintainable, and well-documented scripts and access controls.
Project Sponsor	Project Governance	On-time delivery, budget adherence, and ROI realization.

4. High-Level Business Requirements

Req ID	Business Requirement Description	Priority
BR-01	The system must automatically aggregate raw data from 5 to 10 disparate source Google Sheets into a centralized master database.	High
BR-02	The system must provide a dynamic, interactive dashboard allowing users to filter data by date, region, and category.	High
BR-03	The system must automatically generate and send formatted email reports (with dynamic attachments) based on predefined schedules.	High
BR-04	The system must enforce strict role-based access controls (Viewer, Editor, Admin) within the Google Workspace environment.	Medium
BR-05	The system must include an automated error-logging mechanism to notify the IT team if data extraction or email triggers fail.	High

5. Project Scope

In-Scope:

- Integration of existing Google Sheets data sources.
- Development of Google Apps Script for ETL (Extract, Transform, Load) processes.
- Creation of a dynamic Google Sheets Dashboard (Charts, Pivot Tables, Slicers).
- Configuration of time-driven automated email triggers.
- User Acceptance Testing (UAT) and end-user training.

Out-of-Scope:

- Migration of legacy data from external databases (e.g., SQL, Oracle) into Google Sheets.
- Development of custom web applications or mobile apps.
- Integration with third-party BI tools (e.g., Tableau, PowerBI) unless specified in Phase 2.

6. Success Metrics & KPIs

- **Process Efficiency:** Manual reporting hours reduced from ~40 hours/week to <8 hours/week.
- **System Performance:** Dashboard load time of < 5 seconds; Script execution completing within Google's 6-minute quota.
- **Reliability:** 100% successful execution of scheduled email triggers over a 30-day post-go-live period.
- **User Adoption:** 100% of target stakeholders actively use the dashboard within 2 weeks of launch.

7. Assumptions, Constraints & Dependencies

- **Assumptions:** Source sheet structures will remain stable during the project; Client stakeholders will provide feedback within 3 business days.
- **Constraints:** Strict adherence to Google Apps Script daily quota limits and 6-minute execution time limits.
- **Dependencies:** Timely provision of Google Workspace access and source sheet permissions by the client IT team.
